"The whole of Science is nothing more than a refinement of everyday thinking."

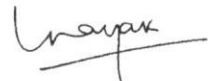

- Einstein

It is not uncommon to see the clinical researches of today following more and more stringent measures to arrive at a definite conclusion. The science today talks of facts based on evidence, with adequate rationale behind each result derived from the study. Inferring tall claims or far reaching conclusion is not taken well by the scientific community today. What we, as clinicians, need to cultivate is an aptitude towards scientific research, a frame of mind where analytical thinking is a continuous process and an outlook with which we can see everyday science around us. Such qualities, if adopted, help us not only in better treatment of our cases, but also in evaluating their outcome in light of the latest advancements in science.

Pursuing the common interest of the readers and the Council for scientific knowledge, we have for you another issue of the journal, consisting of the studies that will trigger your grey matter

and leave you more informed about homoeopathic researches. A study on 'the structure of liquid water; novel insights from materials research; potential relevance to homeopathy', a multicentric double blind homoeopathic pathogenetic trial on 'Saraca indica', a follow-up study on 'the efficacy of the homeopathic remedy Arsenicum album in volunteers living in high risk arsenic contaminated areas', a case record of an 'HIV-infected individual maintaining asymptomatic status for ten years under homoeopathic treatment' will make for a thought-provoking reading, along with other articles.

I wish to thank those who have already started contributing their articles for the journal, after we have made it an open platform by publishing research studies from outside the Council as well. The Council would like to receive more and more research-oriented, controlled studies for the journal in future.

Prof. C. Nayak
